LAST NAME (PRINTED), *FIRST NAME*

RULES:

1. The exam is open book, open lecture handouts and slides, open recitation notes, open HW solutions, open internet (under the communication and usage restrictions mentioned below).
2. If you use MATLAB or any other scientific software to complete some parts of the exam. You are required to submit your script along with your solution in such case.
3. You are not allowed to communicate with anyone other than the Course instructor and the GSIs related to the exam during the entire period. If you have questions, you can post a private Piazza post for the instructors or email `necmiye@umich.edu` with GSIs on cc.
4. You are not allowed to use any online "course helper" sites like Chegg, Course Hero, and Slader, in any part of the exam. You are not allowed to post exam questions on the internet or discuss them online.
5. Please do not wait until the last minute to upload your solution to Gradescope and double-check to make sure you uploaded the correct pdf. If you run into problems with Gradescope, email your .pdf file as an attachment to Prof. Ozay as soon as practicable at `necmiye@umich.edu`.

SUBMISSION AND GRADING INSTRUCTIONS:

1. The maximum possible score is 80. To maximize your own score on this exam, read the questions carefully and write legibly. For those problems that allow partial credit, show your work clearly.
2. You must submit your solutions in a single pdf. You will be asked to mark where each solution is.
3. **Honor Code:** The first page of your submitted pdf should include a hand-written and signed honor code (see the first page of this pdf). Without this, your exam will not be graded.
4. **For problems 1-5** Use this page to record your answers. We will NOT grade other pages and we do not care if you make a mistake when copying your answers to this page. Please be careful. If you are submitting handwritten (or word-processed) documents, make sure to make a similar table where you record all your True/False answers. There is no partial credit on these questions. You are welcome to leave some justification but we will not look at them.
5. **For problems 6-7** Record your final answer in the box provided. If you are submitting handwritten (or word-processed) documents, make sure to box or highlight the final result. However, you MUST show your work to get credit. In other words, a correct result with no reasoning or wrong reasoning could lead to no points.
6. **For problems 8a, 8b** These are proof questions. You should show all the steps of your proof carefully.

Answers for the True/False Part

	(a)	(b)	(c)	(d)
Problem 1	T	T	F	F
Problem 2	T	F	F	T
Problem 3	F	T	T	T
Problem 4	T	T	F	F
Problem 5	F	F	T	T

Problems 1 - 5 (30 points: 5 × 6)

Instructions. For each problem, you should select True or False. **Make sure to record your answers on the second page. Only the second page will be graded!!!**

1. (Questions on logic and proof methods) Recall that $\wedge$ is 'and', $\vee$ is 'or', and $\neg$ is 'not'. Recall also that the symbol $\Leftrightarrow$ and the written text, "if, and only if", "logically equivalent to", and "have the same truth table", all mean the same thing. For example, in HW, you verified that $\neg(p \wedge q)$ is "logically equivalent to" $(\neg p) \vee (\neg q)$ by proving "they have the same truth table". **Answer True or False as appropriate for the following statements. Record your answers on the second page.**

T **F** (a) Negation of "The sky is blue if and only if the grass is green" is "(The sky is not blue and the grass is green) or (The sky is blue and the grass is not green)".

T **F** (b) Let $s_1 : [0,T] \to \mathbb{R}$ and $s_2 : [0,T] \to \mathbb{R}$ be two real valued functions, and let $B \subset \mathbb{R}$. Then,

$$\neg\left(\forall t \in [0,T],\ (s_1(t) \notin B) \wedge (s_2(t) \notin B) \wedge (s_1(t) \neq s_2(t))\right) \Leftrightarrow \left(\exists t \in [0,T],\ (s_1(t) \in B) \vee (s_1(t) = s_2(t)) \vee (s_2(t) \in B)\right)$$

$\neg(\neg p \vee q) = p \wedge \neg q$

T **F** (c) You seek to show $p \implies q$ by employing the method of *Proof by Contradiction*. This means that you assume that p is FALSE and q is TRUE, and then seek to deduce a logical statement R that is both TRUE and FALSE.

$p = \neg q$

T **F** (d) The truth table given below is correct for $\neg p$ implies q:

$\neg p$	p	q	$\neg p \implies q$
0	1	1	1
0	1	0	1
1	0	1	~~0~~ 1
1	0	0	~~1~~ 0

$Av = \lambda v = 0$

2. (Eigenvalues and eigenvectors, linear independence) **Answer True or False as appropriate for the following statements. Record your answers on the second page.**

T **F** (a) Let $A \in \mathbb{R}^{n \times n}$. If a nonzero vector v is in the nullspace of A (i.e., $v \in \mathcal{N}(A)$), then v is an eigenvector of A.

T **F** (b) For all $x \in \text{span}\{v^1, v^2, \ldots, v^m\}$ for $m \leq n$ where each v^i is an eigenvector of a $n \times n$ real matrix, there exist unique coefficients $\alpha_1, \ldots, \alpha_m \in \mathbb{C}$ such $x = \sum_i^m \alpha_i v^i$.

T **F** (c) If matrix A has repeated eigenvalues, then A is always not diagonalizable.

T **F** (d) Let I denote the $n \times n$ identity matrix. For all $x \in \mathbb{R}^n$ and for all $\alpha \in \mathbb{R}$, if $A = xx^\top + \alpha I$, then $\{x, Ax\}$ must be linearly dependent over $\mathbb{R}$.

3. (Matrix properties) **Answer True or False as appropriate for the following statements. Record your answers on the second page.**

T **F** (a) Let $M = \begin{bmatrix} A & B \\ C & D \end{bmatrix} \in \mathbb{R}^{n\times n}$ be invertible and let A and D be square. Then, A and D are invertible.

T **F** (b) Let $M = \begin{bmatrix} A & B \\ B^\top & C \end{bmatrix} \in \mathbb{R}^{n\times n}$ be a symmetric positive definite matrix. Then, $A - BC^{-1}B^\top + C$ is always positive definite.

T **F** (c) Suppose P is an $n \times n$ real symmetric positive definite matrix, and Q be an $n\times n$ orthogonal matrix. In the vector space $(\mathbb{R}^n, \mathbb{R})$, $< x, y >= x^\top QPQ^\top y$ satisfies all the conditions of inner product.

T **F** (d) Let A and B be $n \times m$ real matrices.[1] Then, $[A^\top B]_{ij} = (A_i)^\top B_j$.

symmetry

pos. d

$\begin{bmatrix} 1-\lambda & 2 \\ 3 & 4-\lambda \end{bmatrix}$ $4 - 5\lambda + \lambda^2 + 6$ m×n n×m $\lambda^2 - 5\lambda + 10$

$\begin{bmatrix} 1 & 1 \\ 2 & 2 \end{bmatrix}$ $\begin{bmatrix} 1-\lambda & 1 \\ 2 & 2-\lambda \end{bmatrix}$ $2 - 3\lambda + \lambda^2 - 2$

$\lambda = 0, 3$

$\begin{bmatrix} 2 & 2 \\ 4 & 4 \end{bmatrix} = \begin{bmatrix} 2-\lambda & 2 \\ 4 & 4-\lambda \end{bmatrix}$ $8 - 6\lambda + \lambda^2 - 8$, $\lambda = 0, 6$

4. (Inner product spaces, norms, projection theorem) **Answer True or False as appropriate for the following statements. Record your answers on the second page.**

T **F** (a) In $(\mathbb{R}^{n\times n}, \mathbb{R})$, $\rho(A) = |\lambda_{max}(A)|$ is a norm.[2]

T **F** (b) Consider the inner product space $(\mathbb{R}^{n\times n}, \mathbb{R}, < \bullet, \bullet >)$ with inner product defined as $< A, B >:= \mathrm{tr}(A^\top B)$. Let $\mathcal{S} = \{A \in \mathbb{R}^{n\times n} \mid A^\top = A\}$. Then, $\mathcal{S}^\perp = \{A \in \mathbb{R}^{n\times n} \mid A^\top = -A\}$.

T **F** (c) There exists a finite-dimensional real inner product space $(\mathcal{X}, \mathbb{R}, < \bullet, \bullet >)$ and two vectors $y_1, y_2 \in \mathcal{X}$ such that $< y_1, y_1 >= 1$, $< y_2, y_2 >= 2$, and $< y_1, y_2 >= 3$.

T **F** (d) Let $A \in \mathbb{R}^{m\times n}$, $x \in \mathbb{R}^n$, $b \in \mathbb{R}^m$, $m > n$, and $nullity(A) = 0$. Then $x = (A^T A)^{-1} A^T b$ is a unique exact solution of $Ax = b$.

$A_1 \in S$, $A_2 \in S^\perp$ $|\langle y_1, y_2\rangle| \le \langle y_1, y_1\rangle^{1/2} \cdot \langle y_2, y_2\rangle^{1/2}$

$\langle A_1, A_2\rangle = tr(A_1^T A_2) = tr(A_1 A_2)$

$\langle A_2, A_1\rangle = tr(A_2^T A_1) = tr(-A_2 A_1)$

$= tr(-(A_2 A_1)^T)$

$= tr(-A_1^T A_2^T)$

[1]Recall that for any real matrix M, M_i denotes its i-th column and $[M]_{ij}$ denotes its ij-element.

[2]Here $\lambda_{max}(A) \in \mathbb{C}$ denotes the eigenvalue of A with the largest magnitude. Recall also that for a complex number $z \in \mathbb{C}$, $|z|$ denotes its magnitude.

$\begin{bmatrix} a & b \\ b & c \end{bmatrix} \begin{bmatrix} 0 & d \\ -d & 0 \end{bmatrix} = \begin{bmatrix} -bd & ad \\ -cd & bd \end{bmatrix}$

$A v_1 = \lambda_1 v_1 \qquad B v_2 = \lambda_2 v_2 \qquad (A+B) v_3 = (\lambda_1 + \lambda_2) v_3$

5. You are tasked to pick a sensor system that is capable of estimating an unknown quantity $x \in \mathbb{R}^3$. Each sensor i gives a measurement of the form $y_i = C_i x$ (**we assume no noise unless otherwise stated** - these are very expensive sensors :-)), where $C_i \in \mathbb{R}^{1\times 3}$. Here is the list of sensors you must pick from:

$$C_1 = \begin{bmatrix} 1 & 0 & -1 \end{bmatrix}$$

$$C_2 = \begin{bmatrix} 0 & 2 & -1 \end{bmatrix}$$

$C_{5\times 3} \quad x_{3\times 1}$

$$C_3 = \begin{bmatrix} 0 & -2 & 0 \end{bmatrix}$$

$$C_4 = \begin{bmatrix} -1 & 0 & -1 \end{bmatrix}$$

$$C_5 = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix}$$

In what follows, if we say k sensors are selected from the above list, we mean the observation model is $y = Cx$ where $C \in \mathbb{R}^{k\times 3}$ and rows of C consist of selected sensors. When we say perfectly solve for the unknown $x \in \mathbb{R}^3$, what we mean is that given y, you can find a $\hat{x}$ and you can guarantee that $\hat{x} = x$.

Answer True or False as appropriate for the following statements. Record your answers on the second page.

T **F** (a) Selecting any set of three sensors from the above list (i.e., $C = \begin{bmatrix} C_i \\ C_j \\ C_k \end{bmatrix}$ with $i \neq j, j \neq k, i \neq j$, and $y = Cx$) is sufficient to perfectly solve for the unknown $x \in \mathbb{R}^3$ given a single measurement $y \in \mathbb{R}^3$.

T **F** (b) The minimum number of sensors that can be selected from the above list so that one can perfectly solve for the unknown $x \in \mathbb{R}^3$ is ~~2~~. 3

$$\begin{bmatrix} y \end{bmatrix} = \begin{bmatrix} C \end{bmatrix} \begin{bmatrix} x \end{bmatrix}$$

T **F** (c) If we use all of the sensors (i.e., $C = \begin{bmatrix} C_1 \\ C_2 \\ C_3 \\ C_4 \\ C_5 \end{bmatrix}$), then there exists some $x \in \mathbb{R}^3$ such that $y = \begin{bmatrix} 1 \\ 0 \\ 3 \\ -1 \\ 1 \end{bmatrix}$ is a possible measurement we can observe when measuring some $x \in \mathbb{R}^3$ with this C.

T **F** (d) Assume $C = \begin{bmatrix} C_1 \\ C_2 \\ C_3 \\ C_4 \\ C_5 \end{bmatrix}$ as before. However, one and only one of the sensors has an error (i.e., there exists a unique $i^* \in \{1,2,3,4,5\}$ such that $y_{i^*} = C_{i^*} x + e$ for some error $e \in \mathbb{R}$ and $y_j = C_j x$ for all the remaining $j \in \{1,2,3,4,5\} \setminus \{i^*\}$). You obtain the measurement $y = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$. Then, it is not always possible to tell which sensor failed (i.e., there exists an $x \in \mathbb{R}^3$ that can result in the given measurement y in the existence of a single sensor failure for which it is not possible to tell what i^* is).

$$\begin{bmatrix} y \end{bmatrix} = \begin{bmatrix} C \end{bmatrix} \begin{bmatrix} x \end{bmatrix}$$

$0.9 + 0.1$

$$\left(\begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} + e \right) = \begin{bmatrix} 1 & 0 & -1 \\ 0 & 2 & -1 \\ 0 & -2 & 0 \\ -1 & 0 & -1 \\ 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} x_1 - x_3 \\ 2x_2 - x_3 \\ -2x_2 \\ -x_1 - x_3 \\ x_1 \end{bmatrix}$$

Partial Credit Section of the Exam

For the next problems, partial credit is awarded and you MUST show your work. Unsupported answers, even if correct, receive zero credit. In other words, right answer, wrong reason or no reason could lead to no points. If you come to me and ask whether you have written enough, my answer will be,

“I do not know”,

because answering "yes" or "no" would be unfair to everyone else. If you show the steps you followed in deriving your answer, you'll probably be fine. <u>If something was explicitly derived in lecture, handouts or homework, you do not have to re-derive it. You can state it as a known fact and then use it.</u> For example, we proved that the Gram Schmidt Process produces orthogonal vectors. So if you need this fact, simply state it and use it.

6. (15 points) Let $\mathcal{X}$ be the set of 2×2 matrices with coefficients in $\mathbb{R}$ ($\mathcal{X} = \mathbb{R}^{2\times 2}$). Consider the linear transformation $L : \mathcal{X} \to \mathcal{X}$ given by

$$L(M) = \begin{bmatrix} 0.9 & 0.2 \\ -0.1 & 1 \end{bmatrix} M \begin{bmatrix} 0.9 & 0.1 \\ 0.2 & 1 \end{bmatrix} - M^\top,$$

We know that

$$v^1 = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}, \quad v^2 = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}, \quad v^3 = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}, \quad v^4 = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}$$

is a basis for $\mathcal{X}$.

(a) (10 points) Find the matrix representation A of this linear transformation with respect to the basis $\{v^1, v^2, v^3, v^4\}$.

$$A = \begin{bmatrix} -0.19 & 0.04 & 0.18 & 0.18 \\ -0.01 & 0 & -0.1 & 0.1 \\ 0.09 & 0.2 & 0.9 & -0.98 \\ -0.09 & 0.2 & -1.02 & 0.9 \end{bmatrix}$$

(b) (5 points) Give the change of basis matrix P from $\{v^1, v^2, v^3, v^4\}$ to $\{\bar{v}^1, \bar{v}^2, \bar{v}^3, \bar{v}^4\}$ where

$$\bar{v}^1 = v^1, \quad \bar{v}^2 = v^1 + v^2, \quad \bar{v}^3 = 3v^1 + v^2 + v^3, \quad \bar{v}^4 = v^1 - v^2 + v^3 - v^4$$

$$P = \begin{bmatrix} 1 & 1 & 3 & 1 \\ 0 & 1 & 1 & -1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & -1 \end{bmatrix}^{-1}$$

Note: You are not asked to show the linear independence of $\{\bar{v}^1, \cdots, \bar{v}^4\}$. And, to be extra clear, you are NOT being asked to find the matrix representation of L in the new basis $\{\bar{v}^1, \cdots, \bar{v}^4\}$....you only need to compute the change of basis matrix. If you need to invert a matrix, you can show it as $[\quad]^{-1}$; you do not need to compute the inverse.

$\boxed{6}$ (a) $\qquad$ (A^i = i th column of A)

$$A^i = [L(v^i)]_v$$

$$A^1 = [L(v^1)]_v = \begin{bmatrix} -0.19 & 0.09 \\ -0.09 & -0.01 \end{bmatrix}_v = \begin{bmatrix} -0.19 \\ -0.01 \\ 0.09 \\ -0.09 \end{bmatrix}$$

$$A^2 = [L(v^2)]_v = \begin{bmatrix} 0.04 & 0.2 \\ 0.2 & 0 \end{bmatrix}_v = \begin{bmatrix} 0.04 \\ 0 \\ 0.2 \\ 0.2 \end{bmatrix}$$

$$A^3 = [L(v^3)]_v = \begin{bmatrix} 0.18 & 0.9 \\ -1.02 & -0.1 \end{bmatrix}_v = \begin{bmatrix} 0.18 \\ -0.1 \\ 0.9 \\ -1.02 \end{bmatrix}$$

$$A^4 = [L(v^4)]_v = \begin{bmatrix} 0.18 & -0.98 \\ 0.9 & 0.1 \end{bmatrix}_v = \begin{bmatrix} 0.18 \\ 0.1 \\ -0.98 \\ 0.9 \end{bmatrix}$$

Please show your work for

```python
import numpy as np

# Q6 - (a)
def L(M):
    Q = np.array([[0.9, 0.2], [-0.1, 1]])
    K = np.array([[0.9, 0.1], [0.2, 1]])
    return Q.dot(M).dot(K) - np.transpose(M)

v1 = np.array([[1, 0], [0, 0]])
v2 = np.array([[0, 0], [0, 1]])
v3 = np.array([[0, 1], [0, 0]])
v4 = np.array([[0, 0], [1, 0]])
print(L(v1))
print(L(v2))
print(L(v3))
print(L(v4))
```

code for 6(a)

(p^i = ith column of P)

(b) $p^i = [\ v^i\ ]_{\bar{v}}$

$$(P^{-1})^i = [\ \bar{v}^i\ ]_v$$

$$(P^{-1})^1 = [\bar{v}^1]_v = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$(P^{-1})^2 = [\bar{v}^2]_v = \begin{bmatrix} 1 \\ 1 \\ 0 \\ 0 \end{bmatrix}$$

$$(P^{-1})^3 = [\bar{v}^3]_v = \begin{bmatrix} 3 \\ 1 \\ 1 \\ 0 \end{bmatrix}$$

$$(P^{-1})^4 = [\bar{v}^4]_v = \begin{bmatrix} 1 \\ -1 \\ 1 \\ -1 \end{bmatrix}$$

$$P^{-1} = \begin{bmatrix} 1 & 1 & 3 & 1 \\ 0 & 1 & 1 & -1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & -1 \end{bmatrix}$$

$$P = \begin{bmatrix} 1 & 1 & 3 & 1 \\ 0 & 1 & 1 & -1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & -1 \end{bmatrix}^{-1}$$

7. (20 points) Consider the inner product space $(\mathbb{R}^{2\times 2}, \mathbb{R}, < \bullet, \bullet >)$ with inner product defined as $< A, B >:= \mathrm{tr}(A^\top B)$. Define $S = \mathrm{span}\left\{ \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 3 \\ -1 & 2 \end{bmatrix} \right\}$.

Record your results on this page. You can use this page or the next page to show your work and/or to state your reasoning. Unsupported answers, even if correct, receive zero credits.

(a) (2 points) Find a basis u for S.

$$u = \left\{ \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \right\}$$

(b) (2 points) Let $W = \begin{bmatrix} 2 & 5 \\ -1 & 4 \end{bmatrix}$. Find the representation $[W]_u$ of W with respect to the basis you find in the above bullet.

$$[W]_u = \begin{bmatrix} 4 \\ -2 \\ -1 \end{bmatrix}$$

(c) (8 points) Find a basis for $S^\perp$, the orthogonal complement of S.

$$(\text{basis for } S^\perp) = \left\{ \begin{bmatrix} 1 & 1 \\ -1 & -2 \end{bmatrix} \right\}$$

(d) (8 points) Let $Y = \begin{bmatrix} 0 & 1 \\ 1 & 2 \end{bmatrix}$. Find $\hat{X} = \mathrm{argmin}_{X \in S} d(Y, X)$, where the distance d is defined as

$$d(X, Y) = sqrt(\mathrm{tr}((X - Y)^\top (X - Y))).$$

$$\hat{X} = \frac{1}{7} \begin{bmatrix} 4 & 11 \\ 3 & 6 \end{bmatrix}$$

7. (d) $\alpha = (G^T)^{-1}\beta$, where $(G)_{ij} = \langle v_i, v_j \rangle$, $\beta_i = \langle Y, v_i \rangle$

$$\hat{x} = \sum_{i=1}^{3} \alpha_i u_i$$

$$\langle v_1, v_1 \rangle = tr\left(\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix} \right) = 3$$

$$\langle v_1, v_2 \rangle = tr\left(\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix} \right) = 0$$

$$\langle v_1, v_3 \rangle = tr\left(\begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} \right) = 1$$

$$\langle v_2, v_3 \rangle = tr\left(\begin{bmatrix} 1 & 0 \\ -1 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 0 & 1 \\ 0 & -1 \end{bmatrix} \right) = -1$$

$$\langle v_2, v_2 \rangle = tr\left(\begin{bmatrix} 1 & 0 \\ -1 & 0 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \right) = 2$$

$$\langle v_3, v_3 \rangle = tr\left(\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) = 2$$

$$G = \begin{bmatrix} 3 & 0 & 1 \\ 0 & 2 & -1 \\ 1 & -1 & 2 \end{bmatrix} \Rightarrow G^T = \begin{bmatrix} 3 & 0 & 1 \\ 0 & 2 & -1 \\ 1 & -1 & 2 \end{bmatrix} \Rightarrow G^{-T} = \begin{bmatrix} 3/7 & -1/7 & -2/7 \\ -1/7 & 4/7 & 3/7 \\ -2/7 & 3/7 & 6/7 \end{bmatrix}$$

$$\langle Y, v_1 \rangle = tr\left(\begin{bmatrix} 0 & 1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 0 & 1 \\ 1 & 3 \end{bmatrix} \right) = 3$$

$$\langle Y, v_2 \rangle = tr\left(\begin{bmatrix} 0 & 1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 0 & 0 \\ 1 & -1 \end{bmatrix} \right) = -1$$

$$\langle Y, v_3 \rangle = tr\left(\begin{bmatrix} 0 & 1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \right) = tr\left(\begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix} \right) = 2$$

$$\beta = \begin{bmatrix} 3 \\ -1 \\ 2 \end{bmatrix}$$

$$\Rightarrow \alpha = G^{-T}\beta = 1/7 \begin{bmatrix} 3 & -1 & -2 \\ -1 & 4 & 3 \\ -2 & 3 & 6 \end{bmatrix} \begin{bmatrix} 3 \\ -1 \\ 2 \end{bmatrix} = \begin{bmatrix} 6 \\ -2 \\ 3 \end{bmatrix} \cdot 1/7$$

$$\Rightarrow \hat{x} = \sum_{i=1}^{3} \alpha_i u_i = 1/7 \left(6 \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} - 2 \begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix} + 3 \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \right)$$

$$= 1/7 \begin{bmatrix} 4 & 11 \\ 3 & 6 \end{bmatrix}$$ ※

Please show your work for question 7.

```python
# Q7 - (d)
G = np.array([[3, 0, 1], [0, 2, -1], [1, -1, 2]])
print(np.linalg.inv(G))
beta = np.array([[3], [-1], [2]])
print(np.linalg.inv(G).dot(beta))
```

code for 7(d)

$$2\begin{bmatrix}1&1\\0&1\end{bmatrix} - 2\begin{bmatrix}1&-1\\0&0\end{bmatrix} - \begin{bmatrix}0&1\\1&0\end{bmatrix} = \begin{bmatrix}0&3\\-1&2\end{bmatrix}$$

(b)

$$\alpha_1\begin{bmatrix}1&1\\0&1\end{bmatrix} + \alpha_2\begin{bmatrix}1&-1\\0&0\end{bmatrix} + \alpha_3\begin{bmatrix}0&1\\1&0\end{bmatrix} = \begin{bmatrix}2&5\\-1&4\end{bmatrix}$$

$$\begin{cases}\alpha_1+\alpha_2=2\\ \alpha_1-\alpha_2+\alpha_3=5 \quad \Rightarrow \alpha_2=-2\\ \alpha_3=-1\\ \alpha_1=4\end{cases}$$

$$\begin{bmatrix}1&0\\1&1\end{bmatrix} \quad \begin{bmatrix}1&0\\-1&0\end{bmatrix} \quad \begin{bmatrix}0&1\\1&0\end{bmatrix}$$

(c)

$$\dim(S)+\dim(S^{\perp}) = \dim(\mathbb{R}^{2\times 2}) = 4$$

The basis of S only includes one matrix A $\begin{bmatrix}a&c\\b&d\end{bmatrix}$

$$\langle u_1, A\rangle = 0 = tr\left(\begin{bmatrix}a&c\\a+b&c+d\end{bmatrix}\right) = a+c+d$$

$$\langle u_2, A\rangle = 0 = tr\left(\begin{bmatrix}a&c\\-a&-c\end{bmatrix}\right) = a-c$$

$$\langle u_3, A\rangle = 0 = tr\left(\begin{bmatrix}b&d\\a&c\end{bmatrix}\right) = b+c$$

let $a=1 \Rightarrow b=-1,\ c=1,\ d=-2$ ※

$$\Rightarrow A = \begin{bmatrix}1&1\\-1&-2\end{bmatrix}$$

8. (15 points) (Proof Problem) (Done in two parts so that you cannot lose too many points on each part)

(a) (7.5 points) Let $(\mathcal{X}, \mathbb{R})$ be the real vector space of real-valued continuous functions over $[-2, 2]$, that is, $\mathcal{X} = \{f : [-2, 2] \to \mathbb{R},\ f \text{ continuous}\}$. In class we defined an inner product on this vector space by $< f, g > := \int_{-2}^{2} f(t)g(t)dt$. Suppose we define the function

$$\eta(t) = \begin{cases} |t| & \text{for } |t| > 1 \\ 1 & \text{for } |t| \leq 1 \end{cases}.$$

Is $< f, g >_\eta := \int_{-2}^{2} f(t)\eta(t)g(t)\, dt$ a valid inner product on $(\mathcal{X}, \mathbb{R})$? Prove or disprove.

Hint: Note that $< f, g >_\eta = < f, g >$ when $\eta(t) = 1$ for all $t \in [-2, 2]$.

(b) (7.5 points) Let $f : \mathbb{R} \to \mathbb{R}$ be an invertible function with inverse f^{-1} (i.e., for all $x, y \in \mathbb{R}$, $f(x) = y \iff y = f^{-1}(x)$). Let $Y \subseteq \mathbb{R}$ and $Z \subseteq \mathbb{R}$ be given and define two sets: $S_1 = \{x \mid \exists y \in Y, \exists z \in Z,\ x = f(y) + 5 + z\}$ and $S_2 = \{x \in \mathbb{R} \mid \exists z \in Z,\ f^{-1}(x - 5 - z) \in Y\}$. Show that $S_1 = S_2$.

Please show your work for question 8.

$\boxed{8}$

(a)

To show that $\langle f, g\rangle_\eta = \int_{-2}^{2} f(t)\eta(t)g(t)\,dt$ is a valid inner product.

We need to show three properties : (1) symmetry, (2) linearity, (3) positive definiteness

$$\eta(t) = \begin{cases} |t| & \text{for } |t| > 1 \\ 1 & \text{for } |t| \leq 1 \end{cases}$$

(1) Symmetry

$$\begin{aligned}
\langle f, g\rangle_\eta &= \int_{-2}^{2} f(t)\eta(t)g(t)\,dt \\
&= \int_{-2}^{-1} f(t)\,|t|\,g(t)\,dt + \int_{-1}^{1} f(t)g(t)\,dt + \int_{1}^{2} f(t)\,|t|\,g(t)\,dt \\
&= \int_{-2}^{-1} g(t)\,|t|\,f(t)\,dt + \int_{-1}^{1} g(t)f(t)\,dt + \int_{1}^{2} g(t)\,|t|\,f(t)\,dt \\
&= \int_{-2}^{2} g(t)\eta(t)f(t)\,dt \\
&= \langle g, f\rangle_\eta
\end{aligned}$$

$\Rightarrow \forall f, g \in \mathcal{X}, \ \langle f, g\rangle = \langle g, f\rangle$. $\square$

(2) Linearity

pick $\alpha_1, \alpha_2 \in \mathbb{R}$, $f, g \in \mathcal{X}$

$$\begin{aligned}
\langle \alpha_1 f_1 + \alpha_2 f_2, g\rangle_\eta &= \int_{-2}^{2} (\alpha_1 f_1 + \alpha_2 f_2)(t)\,\eta(t)\,g(t)\,dt \\
&= \int_{-2}^{-1} (\alpha_1 f_1 + \alpha_2 f_2)(t)\,|t|\,g(t)\,dt + \int_{-1}^{1} (\alpha_1 f_1 + \alpha_2 f_2)(t)\,g(t)\,dt \\
&\quad + \int_{1}^{2} (\alpha_1 f_1 + \alpha_2 f_2)(t)\,|t|\,g(t)\,dt \\
&= \alpha_1 \left[\int_{-2}^{-1} f_1(t)\,|t|\,g(t)\,dt + \int_{-1}^{1} f_1(t)g(t)\,dt + \int_{1}^{2} f_1(t)\,|t|\,g(t)\,dt\right] \\
&\quad + \alpha_2 \left[\int_{-2}^{-1} f_2(t)\,|t|\,g(t)\,dt + \int_{-1}^{1} f_2(t)g(t)\,dt + \int_{1}^{2} f_2(t)\,|t|\,g(t)\,dt\right] \\
&= \alpha_1 \langle f_1, g\rangle_\eta + \alpha_2 \langle f_2, g\rangle_\eta
\end{aligned}$$

$\Rightarrow \forall \alpha_1, \alpha_2 \in \mathbb{R}, \forall f_1, f_2 \in \mathcal{X}, \forall g \in \mathcal{X}$

$$\langle \alpha_1 f_1 + \alpha_2 f_2, g \rangle = \alpha_1 \langle f_1, g \rangle + \alpha_2 \langle f_2, g \rangle . \square$$

(3) Positive definiteness

pick $f \in \mathcal{X}$

$$\langle f, f \rangle_\eta = \int_{-2}^{2} f(t)\, \eta(t)\, f(t)\, dt$$

$$= \int_{-2}^{-1} f(t)\, |t|\, f(t)\, dt + \int_{-1}^{1} f(t)\, f(t)\, dt + \int_{1}^{2} f(t)\, |t|\, f(t)\, dt$$

$$= \int_{-2}^{-1} \underbrace{f(t)^2\, |t|}_{\geq 0}\, dt + \int_{-1}^{1} \underbrace{f(t)^2}_{\geq 0}\, dt + \int_{1}^{2} \underbrace{f(t)^2\, |t|}_{\geq 0}\, dt$$

$\Rightarrow \forall f \in \mathcal{X}, \langle f, f \rangle_\eta \geq 0$. and $\langle f, f \rangle_\eta = 0 \iff f = 0$

$. \square$

$\boxed{8}$

(b)

To prove that $S_1 = S_2$, we need to show that $S_1 \subset S_2$ and $S_2 \subset S_1$

To show $S_1 \subset S_2$, we pick $\underset{\text{any}}{\wedge}$ $x_1 \in S_1$, where $\exists y_1 \in Y$, $\exists z_1 \in Z$

$x_1 = f(y_1) + 5 + z_1 \in \mathbb{R}$

$$f^{-1}(x_1 - 5 - z_1) = f^{-1}(f(y_1) + 5 + z_1 - 5 - z_1) = f^{-1}(f(y_1)) = y_1 \in Y$$

$\Rightarrow \forall x_1 \in S_1,\ x_1 \in S_2 \Rightarrow S_1 \subset S_2$

To show $S_2 \subset S_1$, we pick $\underset{\text{any}}{\wedge}$ $x_2 \in S_2$, where $z_2 \in Z$,

$f^{-1}(x_2 - 5 - z_2) \in Y$

$$x_2 = f(f^{-1}(x_2 - 5 - z_2)) + 5 + z_2$$

$$= f(y_2) + 5 + z, \text{ where } y_2 = f^{-1}(x_2 - 5 - z) \in Y$$

$\Rightarrow \forall x_2 \in S_2,\ x_2 \in S_1 \Rightarrow S_2 \subset S_1$

$\Rightarrow S_1 = S_2$ ⌧
